

THE
INFORCE
SUITE

Access Data from Multiple Agencies

Solve cases quicker with Visiphor's Web-based InForce Suite. Search & Locate information across multiple agencies from the desk and in the field. Choose from mix-and-match modules to enhance functionality to achieve a higher standard of safety within your community.

MODULES

Intelligent Query

Search & Locate information from other agencies

Photo Search

Search with photos using facial recognition technology to help identify subjects

Line Ups

Use text-based identifiers and/or Photo Search to automate line up creation in minutes

Crime Mapping

Provides investigators with strategic crime mapping functionality both in the field and at the desk

Mobile Search

Enables users to Search & Locate critical information with handheld devices and PDAs

Lead Alert

Facilitates automated repeat searches based on past user queries in order to locate new information as soon as it becomes available

Pre-Book

Eliminates duplicate data-entry and associated errors by streamlining procedures in the field and at the jail for maximized efficiency

ACCESS MORE INFORMATION. FASTER.

The InForce Suite gives patrol officers and Investigators access to important information from multiple agencies. With the base module of the Suite, called Intelligent Query (IQ), officers and investigators can simply search for information by entering Person, Location, Vehicle or Incident details. Then, with the click of a button, InForce IQ distributes the user's search to multiple underlying databases. The user is then provided with a list of results that provides the critical information necessary to solve cases quicker.

A Visiphor implementation in Washington State, for example, integrates multi-agency and cross-jurisdictional RMS and jail management data in RAIN, the Regional Automated Information Network. The result is a vastly simplified Search & Locate process: an officer submits a distributed query through the IQ user-interface ("Search"), signalling behind-the-scenes technology to pull all matched records from multiple data sources ("Locate"). With instant Search & Locate software, officers are properly equipped to effectively fight crime.

MIX & MATCH MODULES

While the base module of the InForce Suite provides agencies with core Search & Locate functionality, many agencies choose to enhance their software system by choosing from six mix-and-match modules:

Photo Search

The Photo Search Module of the InForce Suite is used to match mugshots, artist sketches, or computer generated images to repository data. With facial recognition technology, the Photo Search Module has proven to be an effective time saver for officers and investigators.

Line Ups

Valuable time savings are again realized with automated digital line-ups. In a matter of seconds, a photo line-up is generated using text or Facial Recognition searches that can be used for subject identification. Associated automatic audit trails ensure that legal challenges to identifications are kept to a minimum.

Crime Mapping

The InForce Suite Crime Mapping Module provides users with "just-in-time" crime

mapping functionality. Investigators can strategically set mapping criteria based on specific crime types, time frames and location parameters. Officers, too, can improve their tactics by setting latitudinal and longitudinal coordinates to better fight crime. The InForce Crime Mapping Module can be used both at the office or in the field.

Mobile Search

Perform text-based searches from the palm of your hand with the InForce Suite Mobility Module. When combined with Photo Search, simply snap a picture of a subject with your mobile device and then query against multiple databases to locate subject information in real-time. Visiphor's software is compatible with most PDA or hand-held device using the Windows Mobile 6 Professional or Standard Operating Systems.

Lead Alert

With Lead Alert, receive notifications of a specific query and set up automatic repeat searches at specified time intervals. When a subsequent automatic search gets a hit, users receive an email message alerting them to the new record so users can stay current as new information comes to light.

Pre-Book

The Pre-Book Module of the InForce Suite saves time and eliminates errors involved in the booking process. When an arrest is to be made, officers can copy data from existing subject records to create a new record. With the click of a button, officers save valuable time in the field while avoiding unnecessary errors and inconsistencies common with new data entry.

SUCCESSFUL DEPLOYMENT

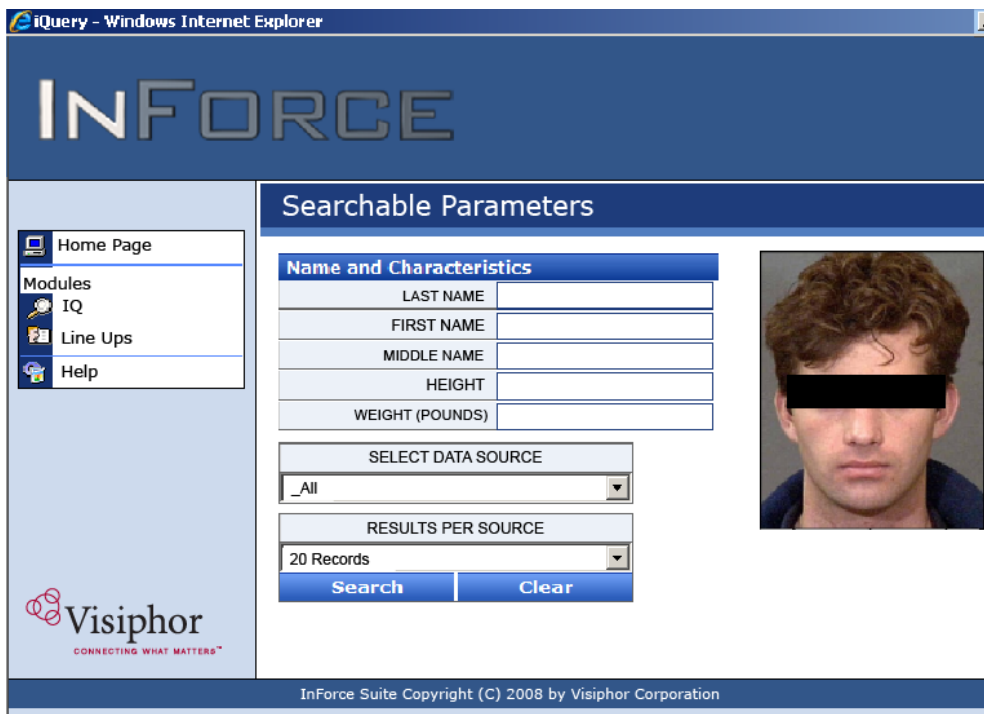

Visiphor is committed to on-time and on-budget product implementations. Typical deployments may range from 3 to 6 months, depending on unique customer requirements. Visiphor's approach to successful delivery relies heavily on teamwork and cooperation with the customer. In addition to the InForce Suite, Visiphor may provide its customers with supplemental training, support, and other services necessary to ensure professional product delivery.

ABOUT VISIPHOR

Visiphor provides commercial off-the-shelf (COTS) software designed to meet law enforcement needs. Our products result from over a decade of working closely with front line law enforcement professionals who understand today's needs better than anyone. Visiphor is compliant to numerous law enforcement industry standards while delivering significant end-user value.

Visiphor is a Microsoft Gold Certified Partner.
